Requirements for SNMPv2 WG Success

- The WG must clearly specify, validate, and get consensus on the most important issues before starting on solutions
- The people most affected by the outcome must be involved in selecting the issues
- The timing of solutions must be factored into the issue list
- Dependencies between agents, mgmt platforms, applications, tools must be considered and factored into the approach

One Set of Suggestions

- Fix the arbitrary differences between v1 and v2
- Make trans & coex easier, even if not cleanest approach
- Move on to more important areas:
  - distributed management
  - event-driven management
  - automation of system testing
  - automation of application development
